1) Grid Search CV

Code:-

sklearn.model_selection.**GridSearchCV**(*estimator*, *param_grid*, *, *, *scoring=None*, *n_job s=None*, *refit=True*, *cv=None*, *verbose=0*, *pre_dispatch='2*n_jobs'*, *error_score=nan*, *return _train_score=False*)

Important Parameters are:-

Exhaustive search over specified parameter values for an estimator. The parameters of

the estimator used to apply these methods are optimized by cross-validated grid-search

over a parameter grid. Exhaustive search means it tries each and every possible

combination and selects the best combination

estimator

This is assumed to implement the scikit-learn estimator interface. Either estimator needs to provide a score function, or must be passed.

scoring

param_grid

Dictionary with parameters names (str) as keys and lists of parameter settings to try as values, or a list of such dictionaries, in which case the grids spanned by each dictionary in the list are explored. This enables searching over any sequence of parameter settings.

scoring

Strategy to evaluate the performance of the cross-validated model on the test set.

cv

Determines the cross-validation splitting strategy.

Important Attributes are:- best_estimator

Estimator that was chosen by the search, i.e. estimator which gave highest score (or smallest loss if specified) on the left out data. Not available if refit=False.

See refit parameter for more information on allowed values.

best_score

Mean cross-validated score of the best_estimator
For multi-metric evaluation, this is present only if refit is specified. This attribute is not available if refit is a function.

best_params

Parameter setting that gave the best results on the hold out data. For multi-metric evaluation, this is present only if refit is specified.

Application:-

```
>>> from sklearn import svm, datasets
>>> from sklearn.model_selection import GridSearchCV
>>> iris = datasets.load_iris()
>>> parameters = {'kernel':('linear', 'rbf'), 'C':[1, 10]} >>> svc = svm.SVC()
>>> clf = GridSearchCV(svc, parameters)
>>> clf.fit(iris.data, iris.target) GridSearchCV(estimator=SVC(),

param_grid={'C': [1, 10], 'kernel': ('linear', 'rbf')})
```

Important Methods : -

Fit(X, y)- fit the linear model.
Predict(X)-predict using linear model.
Score(X,y)-returns the coefficient of determination R^2 of the prediction.
